Innovative stem injection solution to eradicate Japanese knotweed

Japanese Knotweed Control, made their exhibition debut at SALTEX to launch their new stem injection system.

The company offers specialist advice and management control of a wide range of species including Japanese knotweed, Giant Hogweed and Himalayan Balsam, and is set to augment its traditional chemical spraying and 'dig and dump' treatment methods with the new stem injection technique.

The stem injection system works by delivering a measured

dose of herbicide into the centre of the plant rather than just to the surface. This means it targets only the plants injected and there is no environmental risk of spray drift, run-off or contamination of watercourses and other sensitive vegetation.

Treatment times for the removal of Japanese knotweed are claimed to be reduced by up to five times over conventional spraying and the overall cost of weed control reduced.
